Preparation of the tables for reproduction was planned and executed by Jean Van Wagenen. She was assisted by Lisa Boultinghouse, Nancy Chou, Debbie Kitch, and Terry Plummer.

## 1. Introduction and Summary

Renewal theory plays a crucial role in stochastic modeling in a variety of applications such as demand estimation (e.g., White, 1964; Soland, 1968a,b; 1969), inventory theory (e.g., Karlin, 1958; Ross, 1970), reliability (e.g., Barlow and Proschan, 1965, 1975; Gnedenko et al., 1969), manpower planning (e.g., Bartholomew and Forbes, 1979) and warranty analysis (e.g., Blischke and Scheuer, 1975).

Application of renewal theory typically requires knowledge of the renewal function  $H(t)$  (see Section 2) which cannot readily be computed in most cases; an integral equation must be solved or a number of recursively-defined convolutions evaluated. Some tables of the renewal function have been published (see Section 4), but these do not provide a comprehensive set of values and are not widely available. There is a well-known asymptotic approximation to  $H(t)$  for large  $t$ , but this approximation is seldom sufficiently accurate for the small-to-moderate values of  $t$  encountered in practice.

The recent publication of McConalogue's extended cubic splining algorithm (see Section 5) makes it possible to obtain accurate numerical approximations to recursively-defined convolution integrals and hence to the renewal function. Implementation of this algorithm is not straight-forward and hence, in this report, we tabulate the renewal function for five distributions (see Section 3) for a wide range of values of the shape parameter. Corresponding values of the variance function (see Section 2) and the integral of the renewal function are also provided. (The latter is used in the evaluation of the variance of the forward recurrence time and the variance function for the equilibrium renewal process; see Section 2 for definitions.)

In Section 2 we present a few properties of renewal processes and in Section 3 we list the distributions for which we have tabulated renewal

functions. A review of other renewal tables is given in Section 4 and a brief description of the cubic splining algorithm in Section 5. Sections 6 and 7 contain some remarks on convergence and the accuracy of the algorithm respectively, and in Section 8 we discuss the scheme of tabulation. Some numerical examples illustrating the use of the tables are given in Section 9. The tables themselves are appended.

## 2. Renewal Theory

For ease of reference, we present a brief résumé of certain results in renewal theory. See, for example, Smith (1958), Cox (1962), Barlow and Proschan (1965, 1975) and Feller (1971) for further details.

An ordinary renewal process is defined by a sequence of independent, identically distributed, non-negative random variables  $X_1, X_2, X_3, \dots$  with common distribution function  $F$ . We assume that  $f = F'$ ,  $\mu = E(X)$ ,  $\sigma^2 = \text{var}(X)$  and  $\mu_3 = E(X-\mu)^3$  all exist. The renewal counting function,  $N(t)$ , is the number of renewals in  $(0, t]$ , and we define the renewal function  $H(t) = E\{N(t)\}$  and the variance function  $V(t) = \text{var}\{N(t)\}$ .

To give formulae for  $H(t)$  and  $V(t)$ , we need to define the convolution,  $P*Q$ , of two functions  $P$  and  $Q$ , each with support on the nonnegative real line,

$$P*Q(t) = \int_0^t P(t-u) dQ(u).$$

Further, the  $n$ -fold convolution  $P^{(n)}$  of  $P$  with itself is defined as  $P^{(n)} = P^{(n-1)} * P$  for  $n \geq 2$ , with  $P^{(1)} = P$ .

It is well known that

$$(1) \quad H(t) = \sum_{n=1}^{\infty} F^{(n)}(t),$$

$$(2) \quad V(t) = 2H*H(t) + H(t) - [H(t)]^2,$$

that asymptotically, as  $t \rightarrow \infty$ ,

$$(3) \quad H(t) = \frac{t}{\mu} + \frac{\sigma^2}{2\mu^2} - \frac{1}{2} + o(1),$$

$$(4) \quad V(t) = \frac{\sigma^2 t}{\mu^3} + \frac{5\sigma^4}{4\mu^4} - \frac{2\mu_3}{3\mu^3} + \frac{1}{12} + o(1),$$

and that the distribution of  $[N(t) - t/\mu]/[\sqrt{t} \sigma \mu^{-3/2}]$  approaches that of a standard normal variable.

The forward recurrence time,  $\gamma(t)$ , is the time from  $t$  to the next renewal. The pdf of  $\gamma(t)$  is

$$(5) \quad \psi_t(x) = f(t+x) + \int_0^t h(u) f(t+x-u) du$$

where  $h(u) = H'(u)$  is the renewal density. Coleman (1979)\* has shown that

$$(6) \quad E\{\gamma(t)^r\} = E\{(X-t)^r\} - E(X^r) H(t) \\ - r \int_0^t [E(x+u-t)^{r-1} - (u-t)^{r-1}] H(u) du.$$

In particular,

$$(7) \quad E\{\gamma(t)\} = \mu[1+H(t)] - t$$

(which result was previously known) and

$$(8) \quad \text{var}\{\gamma(t)\} = (\sigma^2 + \mu^2) [1+H(t)] - \mu^2 [1+H(t)]^2 + 2\mu[tH(t) - \int_0^t H(u) du].$$

Now  $\lim_{t \rightarrow \infty} \psi_t(x) = \frac{1-F(x)}{\mu}$  and the renewal process for which this is the density of  $X_1$  is the corresponding equilibrium renewal process (erp). The renewal and variance functions for the erp are  $t/\mu$  and

$$(9) \quad v_e(t) = \frac{2}{\mu} \int_0^t H(u) du + \frac{t}{\mu} - \frac{t^2}{\mu^2},$$

respectively. Asymptotically, as  $t \rightarrow \infty$ ,

$$(10) \quad v_e(t) = \frac{\sigma^2}{\mu^3} t + \frac{1}{6} + \frac{\sigma^4}{2\mu^4} - \frac{\mu_3}{3\mu^3} + o(1).$$

---

\* We thank Dr. Coleman for making a copy of his paper available to us prior to its publication.

### 3. Distributions Considered

The density function and the moments for each of the distributions for which tabulations have been made are listed below.

1. Gamma with shape parameter  $\alpha$  and scale parameter  $\beta$

$$f_X(x) = \frac{1}{\beta^\alpha \Gamma(\alpha)} x^{\alpha-1} e^{-x/\beta}, \quad x > 0, \quad \alpha, \beta > 0$$

$$E(X^k) = \beta^k \Gamma(k+\alpha) / \Gamma(\alpha), \quad k=1, 2, \dots$$

2. Inverse Gaussian with parameters  $\mu$  and  $\lambda$ , denoted  $I(\mu, \lambda)$ :

$$f_X(x) = \sqrt{\frac{\lambda}{2\pi x^3}} \exp[-\lambda(x-\mu)^2/2\mu^2 x], \quad x > 0, \quad \mu, \lambda > 0,$$

$$E(X) = \mu, \quad \text{var}(X) = \mu^3/\lambda, \quad E[(X-\mu)^3] = 3\mu^5/\lambda^2.$$

If one makes the transformation  $\phi = \lambda/\mu$ ,  $\gamma = \mu^2/\lambda$ ,  $Y = X/\gamma$ , then

$$f_Y(y) = \sqrt{\frac{\phi^2}{2\pi y^3}} \exp[-(y-\phi)^2/2y], \quad y > 0, \quad \phi > 0,$$

i.e.,  $Y$  has the distribution  $I(\phi, \phi^2)$ . Note that  $\gamma$  is a scale parameter of the distribution of  $X$  and that  $E(Y) = \text{var}(Y) = \phi$ ,  $E[(Y-\phi)^3] = 3\phi$ .

3. Lognormal with parameters  $\mu$  and  $\sigma^2$ ,

$$f_X(x) = \frac{1}{x\sigma\sqrt{2\pi}} \exp\{-(\log x - \mu)^2/2\sigma^2\}, \quad x > 0, \quad \sigma > 0,$$

$$E(X^k) = \exp(k\mu + \frac{1}{2}k^2\sigma^2).$$

If one makes the transformation  $\rho = e^\mu$ ,  $Y = X/\rho$ , then

$$f_Y(y) = \frac{1}{y\sigma\sqrt{2\pi}} \exp\{-(\log y)^2/2\sigma^2\} \quad , \quad y>0 \quad , \quad \sigma>0,$$

i.e.,  $\sigma$  is a scale parameter of the distribution of  $X$ .

4. Truncated Normal with parameters  $\mu$  and  $\sigma$ :

$$f_X(x) = \frac{1}{a\sigma\sqrt{2\pi}} \exp\{-(x-\mu)^2/2\sigma^2\} \quad , \quad x>0 \quad , \quad \sigma>0,$$

where  $a = 1 - \Phi(-\mu/\sigma)$  and  $\Phi(\cdot)$  is the distribution function of the unit normal distribution. Note that if  $X$  is truncated normal with parameters  $\mu$  and  $\sigma$ , then  $Y = X/\sigma$  is truncated normal with parameters  $\frac{\mu}{\sigma}$  and 1, i.e.,  $\sigma$  is a scale parameter of the distribution of  $X$ . The moments are\*

$$E(X^r) = \sigma^r r! \frac{I_r(-\mu/\sigma)}{I_0(-\mu/\sigma)} \quad , \quad r=1, 2, \dots,$$

where

$$I_r(x) = \frac{1}{\sqrt{2\pi}} \int_x^\infty \frac{(t-x)^r}{r!} e^{-t^2/2} dt.$$

Evaluation of the  $I_r(x)$  is most conveniently performed by making use of the following recurrence relation:

$$(r+1)I_{r+1}(x) + xI_r(x) = I_{r-1}(x) \quad , \quad r=0, 1, 2, \dots$$

$$\text{with} \quad I_0(-\mu/\sigma) = 1 - \Phi(-\mu/\sigma)$$

$$\text{and} \quad I_{-1}(-\mu/\sigma) = \frac{1}{\sqrt{2\pi}} e^{-\mu^2/2\sigma^2}.$$

---

\*Source: British Association Mathematical Tables, Vol. I. Published for The Royal Society at the Cambridge University Press, 1951.

5. Weibull with shape parameter  $\alpha$  and scale parameter  $\beta$

$$f_X(x) = \frac{\alpha}{\beta^\alpha} x^{\alpha-1} \exp[-(x/\beta)^\alpha], \quad x > 0, \alpha, \beta > 0$$

$$E(X^k) = \beta^k \Gamma(1 + \frac{k}{\alpha}), \quad k = 1, 2, 3, \dots$$

The gamma, Weibull and truncated normal distributions are widely used to model lifetimes in reliability theory, and their inclusion in this compendium of renewal tables requires no justification. The inverse Gaussian distribution has recently been cited as a suitable life distribution (Chhikara and Folks, 1977) and is thus also included. The lognormal distribution has been advocated as an appropriate model for the completed length of service distribution in manpower planning (Bartholomew and Forbes, 1979) where renewal theory can be used to model the successive appointments to a particular post.

\* \* \* \* \*

For convenience in applying the asymptotic relations (3), (4) and (10), we give numerical values of  $E(X)$ ,  $E(X^2)$  and  $E(X^3)$  for the gamma, lognormal, truncated normal and Weibull distributions for the parameter selections in our tables. We do not list these moments for the inverse Gaussian, as they are simply related to the parameter  $\phi$  (see above at item 2).

#### 4. Other Renewal Tables

White (1964) has tabulated, in our notation,  $H(t)$  and  $[V(t)]^{\frac{1}{2}}$  for the Weibull distribution for  $\alpha=0.5(0.5)3.0(1.0)5.0, 7.0, 10.0$  with  $t=0.00(.05)2.45$  for  $\alpha \leq 4$ ,  $t=0.00(.05)2.05$  for  $\alpha=5$ ,  $t=0.00(.05)1.65$  for  $\alpha=7$  and  $t=0.00(.05)1.45$  for  $\alpha=10$ . White also tabulates  $H(P)$  and  $[V(P)]^{\frac{1}{2}}$ , where  $P=1-\exp(-t^{\alpha})$ , for this range of  $\alpha$  and for  $P=0.00(.02)0.98$ . Further, White gives tables of percentiles and c.d.f.'s, coefficients in the asymptotic expressions for  $H(t)$  and  $V(t)$  and certain terms he uses in his computations. [N.B. White's  $\beta$  is our  $\alpha$ .]

Smith & Leadbetter (1963) and Lomnicki (1966) also discuss the evaluation of the renewal function for the Weibull distribution, but do not provide any tables.

Soland (1968a,b; 1969) has presented gamma and Weibull renewal tables for distributions with increasing hazard (i.e., failure) rate. In each case he has chosen combinations of scale and shape parameters to yield a mean of unity. For both distributions, he tabulates, in our notation,  $H(t)$ ,  $V(t)$  and  $V_e(t)$  for  $\alpha=2(0.25)4(1)6$  with  $t=0.01(.01)2$  for the gamma and  $t=0.01(.01)4$  for the Weibull. Asymptotic expressions for  $H(t)$ ,  $V(t)$  and  $V_e(t)$  are given, as are smallest times  $t$  to bound the absolute percentage error of these asymptotic formulae for various percentages.

Huang (1972), in an unpublished masters thesis, extends Soland's tables for the gamma and Weibull distributions and also provides comparable tables for the lognormal distribution.\* For the gamma and Weibull, Huang tabulates  $H(t)$ ,  $V(t)$  and  $V_e(t)$  for  $\alpha=1.25(0.125)1.875, 2.125(0.250)3.875, 4.25(0.25)4.75, 5.25(0.25)5.75$ . For the gamma,  $t=0.01(.01)2$  and for the

---

\* We are grateful to Professor R. M. Soland for bringing the thesis of his student Huang to our attention and for providing us with a copy.

Weibull,  $t=0.01(.01)4$ . For the lognormal, he tabulates, in our notation,  $H(t)$ ,  $V(t)$  and  $V_e(t)$  for  $\sigma^2=0.05(.05)1.00$ ,  $t=0(.01)4$ . In each of the three distributions he considers, he chooses the second parameter so as to yield a mean of unity.

The present renewal tables extend those of White, Soland and Huang in a number of respects. Firstly, the tables explicitly provide values of  $\int_0^t H(u)du$ . Secondly, renewal tables for the truncated normal and inverse Gaussian distributions are provided. Thirdly, the existing gamma and Weibull renewal tables, with one exception, do not include shape parameter values corresponding to decreasing failure rates. Finally, the existing lognormal table is available only in an unpublished masters thesis.

See Baxter (1981) for a comparison of the computational techniques of White, Soland, and Huang with the cubic splining algorithm.

## 5. The Cubic Splining Algorithm

The algorithm of Cléroux and McConalogue (1976) provides a more general approach to the numerical evaluation of renewal functions than the methods used by the tabulators mentioned in Section 4. This algorithm generates piecewise polynomial approximations to recursively-defined convolutions of the form  $F^{(n)}(t)$  ( $n=1,2,3, \dots$ ) for  $F \in C^2[0,\infty)$ , assuming that  $f=F'$  is bounded, and can hence be used to compute a wide range of functions arising in renewal theory.

The essence of the algorithm is the choice of a cubic-spline representation of  $F^{(n)}$  for each  $n$ . This provides an accurate approximation, preserving both positivity and monotonicity. The abscissa is subdivided into panels of equal width and  $F$  is approximated by a cubic in each panel. The spline representation and its second derivative are continuous at each node; imposing first derivative continuity at the nodes determines the coefficients of the cubics and ensures an extremely smooth representation. The derivative of the cubic spline approximates  $f$ , and hence convolution is reduced to the relatively straightforward task of integrating polynomials numerically. The approximation to  $F^{(n+1)}(t)$  is generated recursively from that for  $F^{(n)}(t)$  ( $n=1,2,3, \dots$ ). Our experience supports the contention of Cléroux and McConalogue (1976): accuracy does not diminish appreciably with increasing  $n$  or  $t$ . For full details of the algorithm, see Cléroux and McConalogue (1976) and McConalogue (1978).

The principal limitation of the Cléroux-McConalogue algorithm (Baxter, 1981) is that it cannot be applied to densities exhibiting an infinite singularity at the origin (e.g., the DFR Weibull and gamma distributions) and is inadequate for densities with a finite singularity at the origin (e.g., the lognormal and inverse Gaussian distributions). McConalogue

(1981) removes these restrictions by extending the algorithm to cope with densities which are not "well-behaved" near the origin. A semi-analytic treatment of  $f$  is required. The extended algorithm permits  $f$  to be unbounded, but assumes that the derivative of  $F^{(n)}$  is bounded for  $n \geq 2$ . This permits the convolution of both the Weibull and the gamma distributions for a shape parameter no less than  $\frac{1}{2}$  and, if the density is bounded, enhances the accuracy of the approximation near the origin, thereby producing more reliable results when the algorithm is applied to the lognormal and inverse Gaussian distributions.

The extended algorithm was used to perform all the calculations for the present study. In each case,  $F^{(n)}(t)$  was computed for  $n=1,2,3, \dots$  using a panel width of 0.1, the intermediate values being obtained by cubic spline interpolation (Clérout and McConalogue, 1976). Note, however, that interpolation in the first panel  $(0,0.1)$  is impossible if there is an infinite singularity at the origin and unreliable if there is a finite singularity. The renewal function was computed by means of equation (1) and  $V(t)$  from equation (2) in which  $H*H(t)$  is calculated by

$$H*H(t) = \sum_{n=1}^{\infty} nF^{(n+1)}(t).$$

The convergence criterion used was

$$nF^{(n+1)}(t) < 10^{-6}.$$

Values of  $\int_0^t H(u)du$  were obtained by direct integration of the spline representation; special treatment is necessary in the first panel as the spline may not be defined there (McConalogue, 1981).

All calculations were performed using the FORTRAN G compiler of the IBM 360/65 at University College London with double precision arithmetic.

Readers interested in the computer programs should inquire of Professor Denis J. McConalogue, Delft University of Technology, Department of Mathematics, 2628 BL Delft, Julianalaan 132, The Netherlands.

## 6. Convergence

The tables of  $H(t)$  and  $V(t)$  enable us to assess the rate of convergence of these functions to their linear asymptotes ((3) and (4) respectively).

"The rate of approach of a renewal function to its linear asymptote is . . . principally determined . . . by the presence of peaks in the density. A density which is, e.g., closely concentrated about some  $a > 0$ , will have . . . a very slow and oscillatory approach of the renewal function to its linear asymptote. I suspect that something similar may happen when there is a singularity near zero." \*

Our results confirm Neuts' conjecture: for  $\alpha < 1$ , the renewal functions of the Weibull and gamma processes converge very slowly to their linear asymptotes. The variance functions converge even more slowly and, for the Weibull process, exhibit a marked oscillation.

Convergence of the renewal functions is very slow indeed for the lognormal process if  $\sigma^2 > 1$  and for the inverse Gaussian process if  $\phi$  is small ( $< .7$ ) or large ( $> 10$ ).

Another form of convergence is the rate of approach of the sequence of partial sums  $\{\sum_{n=1}^k F^{(n)}(t)\}$  to  $H(t)$  as  $k \rightarrow \infty$ . As the number of operations required for each convolution is  $O(m^2)$ , where  $m$  is the number of panels (McConalogue, 1978), an extremely large expenditure of computer time may be required in certain instances. This is the only computational limitation on the use of the extended algorithm. Our experience suggests that for the following approximate ranges, convergence is very slow (i.e., more than 5 minutes CPU time on the FORTRAN G compiler of an IBM 360/65 is required):

Inverse Gaussian	$\phi < .7$
Weibull	$1 < \alpha < 3$
Truncated normal	$\mu < 0$
Gamma	$\alpha < 1$ .

It is interesting to note that the rates of the two types of convergence do not appear to be dependent. Thus, for example, for  $\sigma^2 > 1$ , the renewal

---

\* M. F. Neuts (1979) Personal Communication

function of the lognormal process converges very slowly to its linear asymptote, whereas the sequence of partial sums converges quickly. The reverse is true for the truncated normal process for  $\mu < 0$ . For the inverse Gaussian process with  $\phi < .7$ , both types of convergence are very slow.

## 7. Accuracy

In view of the novelty of McConalogue's algorithm (indeed, no applications of the Cléroux-McConalogue algorithm have yet been published), a few remarks on the accuracy of this procedure, and hence of our tables, may be of interest.

Comparison, where appropriate, with the tables of White, Soland and Huang shows a discrepancy of no more than one digit in the last decimal place, confirming the accuracy of the algorithm for the gamma, Weibull and lognormal distributions. Additional verification in the case of the gamma distribution may be gained by noting that  $F^{(n)}(t; \alpha) \equiv F(t; n\alpha)$  where  $F(t; \alpha) = \int_0^t \frac{x^{\alpha-1} e^{-x}}{\Gamma(\alpha)} dx$  and may hence be evaluated by means of an algorithm for the incomplete gamma function, e.g., that of Bhattacharjee (1970). Values of  $F^{(n)}(t; \alpha)$  obtained in this fashion agree to 6 decimal figures with those given by the cubic splining algorithm.

A check on the values of the renewal function for the truncated normal process with shape parameter  $\mu$ ,  $H_\mu(t)$  say, is given by observing that

$$\lim_{\mu \rightarrow \infty} \left[ H_\mu(t) - \sum_{n=1}^{\infty} \phi(t - n\mu) \sqrt{n} \right] = 0.$$

For  $\mu=4$  and  $t \leq 20$ , the renewal function and its limiting value show agreement to 4 decimal figures.

In certain of the inverse Gaussian and lognormal tables we found dubious values of the tabulated functions for a few small values of  $t$ . These entries were eliminated, hence the "whited-out" portions found there.

## 8. Scheme of Tabulation

Each of the five distributions considered can be parameterized in terms of a shape parameter  $\delta$  and a scale parameter  $\omega$ . (Trivial changes of variable are required for the lognormal and inverse Gaussian distributions; see Section 3.) Without loss of generality, we need only tabulate each of the functions considered for each distribution for  $\omega=1$ ; see Section 9.

We tabulate  $H(t)$ ,  $V(t)$  and  $\int_0^t H(u)du$  for  $t=0(0.05)20$ .\* (However, for reasons mentioned in Section 5, it is necessary to omit the  $t=.05$  entry in a number of cases.) For  $t>20$  the asymptotic approximations (3) and (4) can be used for  $H(t)$  and  $V(t)$ , and  $\int_0^t H(u)du \approx \int_0^{20} H(u)du + \int_{20}^t \left( \frac{x}{\mu} + \frac{\sigma^2 - \mu^2}{2\mu^2} \right) dx$ , where the value of the first integral on the right is read from the tables.

The ranges of shape parameter values  $\delta$  for which the functions are evaluated are as follows:

Weibull:	$\alpha = 0.55(0.05)1(0.25)7$
Gamma:	$\alpha = 0.55(0.05)1(0.25)7$
Lognormal:	$\sigma^2 = 0.1, 0.25(0.25)1(0.5)4$
Truncated Normal:	$\mu = -2(0.25)4$
Inverse Gaussian:	$\phi = 0.5(0.05)1(0.2)2(0.5)9, 10, 12, 15, 20$ .

The lower limit of  $\alpha$  for the Weibull and gamma distributions is due to the inability of the extended algorithm to cope with  $\alpha < 0.5$  (see Section 5). The upper limit is arbitrary; we know of no case where a value of  $\alpha > 7$  has been reported in the literature. For the truncated normal distribution, the upper limit is determined by the fact that for  $\mu > 4$

$$\max_{0 \leq t \leq 20} \left| H(t) - \sum_{n=1}^{\infty} \phi((t-n\mu)/\sqrt{n}) \right| \leq 10^{-4}.$$

---

\* The choice of the upper limit of 20 is arbitrary. It was motivated by the fact that a larger upper limit would require considerably more CPU time.

A lower limit of  $\mu=-2$  was chosen as it is not thought likely that smaller values of  $\mu$  would be useful in practice. The range of values of  $\sigma^2$  for the lognormal distribution is arbitrary: it covers those values of  $\sigma^2$  most likely to arise in practice. For the inverse Gaussian distribution, the lower limit of  $\phi$  is due to the exceptionally large requirement of CPU time for small  $\phi$ ; this requirement increases rapidly as  $\phi \rightarrow 0$ . The upper limit is arbitrary. Note that if  $Y \sim I(\phi, \phi^2)$ , the distribution of  $(Y-\phi)/\sqrt{\phi}$  tends to the unit normal as  $\phi \rightarrow \infty$  (Folks and Chhikara, 1978), but this limiting distribution does not provide an adequate approximation even for  $\phi=20$ .

The choice of the spacings between adjacent values of  $\delta$  is a compromise between the desire to provide a comprehensive set of tables at as uniform a spacing as possible, the need to conserve space and the fact that  $H_\delta(t+0.05) - H_\delta(t)$  can vary quite considerably with  $\delta$  for fixed  $t$ . The minimum variation between values of the function at adjacent values of  $\delta$  is approximately 10%. It is not practical to impose a maximum variation.

The tables attached were reproduced from computer printouts, subsequent to a photo-reduction. There are occasional entries in the resulting product that are not completely legible. In most cases this should not be a serious problem since the correct values can be deduced from that part that is printed and surrounding values. Where this is not possible, correct values can be obtained by contacting Baxter or Blischke.

## 9. Examples

To use the present tables, recall that they are calculated for a scale parameter\* (say  $\omega$ ) value of unity. This causes no loss of generality in view of the identities

$$H(t; \omega) \equiv H(t/\omega; 1),$$

$$V(t; \omega) \equiv V(t/\omega; 1),$$

and

$$\int_0^t H(u; \omega) du \equiv \omega \int_0^{t/\omega} H(u; 1) du. **$$

Example 1: For the gamma distribution with  $\alpha=3$  and  $\beta=1/3$  find: (i)  $H(1.5; 1/3)$ , (ii)  $V(1.5; 1/3)$ , (iii)  $\int_0^{1.5} H(u; 1/3) du$ .

Solutions: Recall that  $\beta$  is a scale parameter.

$$(i) \quad H(1.5; 1/3) = H(4.5) = 1.1663$$

$$(ii) \quad V(1.5; 1/3) = V(4.5) = 0.5764$$

$$(iii) \quad \int_0^{1.5} H(u; 1/3) du = 1/3 \int_0^{4.5} H(u) du = 1/3(2.098) = 0.699.$$

Example 2: For an inverse Gaussian random variable  $X$  with parameters  $\mu=3$ ,  $\lambda=6$ , find (i)  $H(9; 3, 6)$ , (ii)  $V(9; 3, 6)$ ,  $\int_0^9 H(u; 3, 6) du$ .

Solutions: Let  $\phi = \frac{\lambda}{\mu} = 2$ ,  $\gamma = \mu^2/\lambda = 1.5$  and recall that  $\gamma$  is a scale parameter of the distribution of  $X$ .

$$(i) \quad H(9; \mu=3, \lambda=6) = H(9; \phi=2, \gamma=1.5) = H(6; \phi=2, \gamma=1) = 2.7496$$

$$(ii) \quad V(9; \mu=3, \lambda=6) = V(9; \phi=2, \gamma=1.5) = V(6; \phi=2, \gamma=1) = 1.3998$$

---

\*  $\omega$  is a scale parameter of the distribution of  $X$  if the distribution of  $X/\omega$  does not involve  $\omega$ .

\*\* In this section, the arguments of  $H$  and  $V$  will sometimes be written  $(t; \text{shape parameter, scale parameter})$ , sometimes  $(t; \text{scale parameter})$  -- the value of the shape parameter being understood, and sometimes merely  $t$  -- the latter when the scale parameter is unity. In earlier sections, where parameters did not enter specifically, we wrote simply  $H(t)$  and  $V(t)$ . Context will make our usage clear and no confusion should result.

\*\*\* The parameter  $\mu$  should not be confused with  $E(X)$ .

$$\begin{aligned} \text{(iii)} \quad \int_0^9 H(u; \mu=3, \lambda=6) du &= \int_0^9 H(u; \phi=2, \gamma=1.5) du = 1.5 \int_0^6 H(u; \phi=2, \gamma=1) du \\ &= 1.5(7.543) = 11.314. \end{aligned}$$

Example 3: For the lognormal with parameters  $\mu=2$ ,  $\sigma^2=0.75^*$ , find (i)

$$H(20; 2, 0.75), \text{ (ii) } V(20; 2, 0.75), \text{ (iii) } \int_0^{20} H(u; 2, 0.75) du.$$

Solutions: Let  $\rho = \exp(\mu) = e^2 = 7.389$ . Recall that  $\rho$  is a scale parameter.

$$\begin{aligned} \text{(i)} \quad H(20; \mu=2, \sigma^2=0.75) &= H(20; \rho=7.389, \sigma^2=0.75) = H(2.71; \rho=1, \sigma^2=0.75) \\ &= 1.8452 \text{ (by interpolation)} \end{aligned}$$

$$\begin{aligned} \text{(ii)} \quad V(20; \mu=2, \sigma^2=0.75) &= V(20; \rho=7.389, \sigma^2=0.75) = V(2.71; \rho=1, \sigma^2=0.75) \\ &= 1.3914 \text{ (by interpolation)} \end{aligned}$$

$$\begin{aligned} \text{(iii)} \quad \int_0^{20} H(u; \mu=2, \sigma^2=0.75) du &= \int_0^{20} H(u; \rho=7.389, \sigma^2=0.75) du \\ &= 7.389 \int_0^{2.71} H(u; \rho=1, \sigma^2=0.75) du \\ &= 7.389(2.3396) = 17.287 \text{ (by interpolation)}. \end{aligned}$$

Example 4: For a truncated normal distribution with parameters  $\mu=1$  and  $\sigma=2^*$

$$\text{find: (i) } H(30; 1, 2), \text{ (ii) } V(30; 1, 2), \text{ (iii) } \int_0^{30} H(u; 1, 2) du.$$

Solutions: Note that the transformation to a unit scale parameter  $\sigma$  also changes the shape parameter  $\mu$ :  $\sigma \rightarrow 1$ ,  $\mu \rightarrow \frac{\mu}{\sigma}$ .

$$\text{(i)} \quad H(30; \mu=1, \sigma=2) = H(15; \mu=\frac{1}{2}, \sigma=1) = 14.6026$$

$$\text{(ii)} \quad V(30; \mu=1, \sigma=2) = V(15; \mu=\frac{1}{2}, \sigma=1) = 7.2883$$

$$\text{(iii)} \quad \int_0^{30} H(u; \mu=1, \sigma=2) du = 2 \int_0^{15} H(u; \mu=\frac{1}{2}, \sigma=1) du = 2(107.656) = 215.312.$$

Example 5: For the Weibull distribution with parameters  $\alpha=0.6$  and  $\beta=2$ ,

$$\text{find (i) } H(5; 2), \text{ (ii) } V(5; 2), \text{ (iii) } \int_0^5 H(u; 2) du.$$

Solutions:

$$\text{(i)} \quad H(5; 2) = H(2.5) = 2.4237$$

$$\text{(ii)} \quad V(5; 2) = V(2.5) = 4.0914$$

$$\text{(iii)} \quad \int_0^5 H(u; 2) du = 2 \int_0^{2.5} H(u) du = 2(3.490) = 6.980.$$

---

\* The parameters  $\mu$  and  $\sigma^2$  should not be confused with  $E(X)$  and  $\text{var}(X)$ .

Example 6: In the context of warranties (Blischke and Scheuer, 1975), consider the random variable  $Y=W+\gamma(W)$ , where  $W$  is a constant (the length of the warranty period). The renewal function  $H_Y$ , corresponding to the random variable  $Y$ , is of interest, but a closed-form expression for it does not seem to be available. However,  $H_Y(t)$  can be approximated by the asymptotic expression (3)

$$H_Y(t) \rightarrow \frac{t}{E(Y)} + \left[ \frac{\text{var}(Y)}{2E^2(Y)} - \frac{1}{2} \right]$$

where  $E(Y)$  and  $\text{var}(Y)$  are obtained from Coleman's formulas (7) and (8):

$$E(Y) = E[W+\gamma(W)] = \mu[1+H(W)] ,$$

$$\text{var}(Y) = \text{var}[\gamma(W)] .$$

Suppose that the lifetime random variable  $X$  has the gamma distribution with parameters  $\alpha=3$ ,  $\beta=1/3$  and that  $W=1.5$ . Let us find an approximation to  $H_Y(10)$ .

We know  $\mu=E(X)=\alpha\beta=1$ ,  $E(X^2)=\beta^2(\alpha^2+\alpha)=4/3$ ,

$$E(Y) = \mu[1+H(W;\beta)] = 1[1+H(1.5;1/3)] = 1+H(4.5) = 2.1663,$$

$$\text{var}(Y) = E(X^2) [1+H(W;\beta)] - \mu^2[1+H(W;\beta)]^2 + 2\mu[WH(W;\beta) - \int_0^W H(u;\beta) du]$$

$$= 4/3 [2.1663] - [2.1663]^2 + 2[(1.5)(1.1663) - .699] = .296$$

(the value of the integral was obtained earlier in example 1)

$$H_Y(10) \approx \frac{10}{E(Y)} + \frac{\text{var}(Y)}{2E^2(Y)} - \frac{1}{2} = \frac{10}{2.1663} + \frac{.296}{2(2.1663)^2} - \frac{1}{2} = 4.1477.$$

FIRST ABSENT = 0.0003  
SECOND ABSENT = 1.7100  
THIRD ABSENT = 4.7510

Inexplicably, computation was cut off at T = 15.00 instead of the planned T=20.00. However, this should cause no serious difficulty as the asymptotic expressions for H(T) and V(T) agree with their exact computed values to four decimal places to the right of the decimal point already for values of T considerably less than 15.00.

FIRST MOMENT = 1.0722  
 SECOND MOMENT = 2.4166  
 THIRD MOMENT = 9.2005

Inexplicably, computation was cut off at T = 15.00 instead of the planned T = 20.00. However, this should cause no serious difficulty as the asymptotic expressions for H(T) and V(T) agree with their exact computed values to four decimal places to the right of the decimal point already for values of T considerably less than 15.00.

Weibull Renewal Tables with  $\alpha = 0.95$

20. ABSTRACT (Continue on reverse side if necessary and identify by block number)		
<p>The generalized cubic splining algorithm enables us to evaluate recursively-defined convolutions for a wide variety of distribution functions. The algorithm has been applied to evaluate the renewal function, variance function and the integral of the renewal function for five distributions (gamma, inverse Gaussian, lognormal, truncated normal and Weibull) for a wide range of values of the shape parameter. The results of the computations are discussed and a comparison is made with previous tabulations.</p>
